- Develop applications for managing   research cycle
- Deployment and maintenance of the deployed contracts such as Non- Fungible Tokens (NFT)
- Converting the research results into business applications

Interested students can contact Eunice at echui22@outlook.com

About Articoin

Articoin is an innovative Green NFT platform that combines art and technology to promote sustainable income to support artists and ESG causes.

With our own "Proof-of-Capacity" blockchain, we use 2,600 times less energy in the process than conventional Ethereum-based marketplaces. We are the first to bundle art with Carbon Credits, bridging the opportunity for consumers to participate in carbon-offset initiatives.   We also built our own proprietary AI technology to generate and view multi-media art.

Certain Green NFTs on Articoin are currently tied with the option to get Carbon Credits generated from CLP's wind farm in India. More partners who

are working on different carbon-reduction projects from around the world can be expected to be integrated onto Articoin this year.

In less than 1 year, our community already has more than 10,000 artists and 12 million art pieces in Asia. We successfully attracted over 30 multinational corporate clients and partners, including K11, and worked with more than 10 major international and local NGOs and charities, such as Fu Hong Society, Zheng Sheng and Food Angel.

Using NFT art as a medium to raise awareness and funds for charities and NGOs, we aim to donate $4 million to our charitable partners while offsetting 10,000 tonnes of carbon emissions in 2022.
